

ABSTRACT

A cover for a child seat in the form of a pad with slots through the pad that facilitate simple removal and reinstallation of the cover. Some of the slots accommodate the seat safety harness and merge with side slots that are held closed by mating separable fastening elements. The side slots extend at least partially along the junction between the backrest portion and the side bolster portions of the pad. A pair of back slots extend from respective strap anchoring locations in the backrest region to respective side slots. A release slot may be included at each side of the pad, extending from the respective side slot to the adjacent outer side edge of the pad – this being especially useful with three-point harness seats. A five-point harness version has a pair of lap strap slots through the pad to accommodate the lap straps of the harness. The lap straps slots extend outwardly to the adjacent side slots. Adding release slots as described gives this latter cover universal application.
